

I plan to do a something along the lines of a todo or cart app in React and Node js. The app will be a proposed curriculum for Code School this summer. The final decision will be made after talking to DJ Holt about the needs for Code School. The app will have basic CRUD capabilities and the API will be RESTful. The app will demonstrate the basics of React and Node with the emphasis on React's abstraction on HTML5 web components. Furthermore, the app will show the unidirectional data flow for saving component state and updating the model.
